## Total Synthesis of the Amino Hip Analogue of Didemnin A

## SUMMARY OF THE INVENTION

Didemnins were isolated from the Caribbean tunicate *Trididemnum solidum*.<sup>1</sup> These cyclic depsipeptides possess a variety of biological activities including *in vitro* and *in vivo* antiviral, antitumor, and immunosuppressive activities.<sup>2-5</sup> They are potent inhibitors of L1210 leukemia cells *in vitro*, and are also active *in vivo* against P388 leukemia and B16 melanoma.<sup>3</sup> Didemnin B, a more active compound of this class, is approximately twenty times more cytotoxic than didemnin A *in vitro* and has undergone phase II clinical trials for antitumor activity.<sup>3</sup> Both didemnins A and B exhibit antiviral activity against DNA and RNA viruses, with didemnin B being more active.<sup>4</sup> The structures of didemnins A and B have been established as 1 and 2, respectively.<sup>6</sup>

### The Structures of Didemnins A and B.

- 2 -

Structure-activity relationship studies have been somewhat limited due to the restricted number of available modifications of the extracted natural compounds. Although the bioactivity of didemnin B has been attributed to its side chain,<sup>1b</sup> few other structural features have been examined. An X-ray crystal structure of didemnin B by Hossain, et al.<sup>7</sup> shows that the  $\beta$ -turn side chain, the isostatine hydroxyl group, and the tyrosine residue extend outward from the rest of the molecule, leading to speculation about their importance for biological activity. Structural changes in those areas have shown these features to be essential for activity.<sup>8</sup>

Although many studies have shed light on the pharmacology and chemistry of didemnins, little is known about their mechanism of action. However, recent biochemical studies of possible binding sites have provided promising results. Studies performed by Shen et al.<sup>9</sup> have shown that didemnin B binds to a site on Nb2 node lymphoma cells and that this binding may be responsible for the immunosuppressive activity. Schreiber and co-workers<sup>10</sup> have reported that didemnin A binds elongation factor-1 $\alpha$  (EF-1 $\alpha$ ) in a GTP-dependent manner which suggests EF-1 $\alpha$  may be the target responsible for the ability of didemnins to inhibit protein synthesis.

We present here synthetic studies toward a modified macrocycle which possesses an amide bond in place of an ester bond (3). A modification such as this is likely to result in an increase in hydrogen bonding at the active site, and thus, provide a more active compound. In addition, the facile nature of the C-O bond leads us to believe replacement of these C-O bonds with C-N bonds may improve the stability of these compounds.

**Synthetic Strategy.** The retrosynthetic disconnections which formed the basis of our plan for the preparation of the protected amino-Hip analogue 3 of didemnin A are illustrated in Scheme I. We envisaged disconnection of the amide function between *N,O*-Me<sub>2</sub>-L-tyrosine and L-proline to give the linear heptapeptide 4 and disconnection between L-threonine and isostatine (3*S*, 4*R*, 5*S*) to afford the two units: a tripeptide unit 5 comprised of *N*-Me-leucine, threonine, and *N,O*-Me<sub>2</sub>-tyrosine; and a tetrapeptide unit 6 comprised of isostatine,  $\alpha$ -( $\alpha'$ -aminoisovaleryl)propionyl (Aip), leucine, and proline.

Scheme I

**Synthesis of Tripeptide 5.** Preparation of the diprotected tripeptide unit is shown in Scheme II. Our approach began with methylation of the uncommon amino acid, Cbz-D-leucine, 7, with  $\text{CH}_3\text{I}/\text{NaH}$ .<sup>11</sup> Coupling of the derivative Cbz-D-MeLeuOH with the hydroxyl group of the threonine derivative L-ThrOEt<sup>12</sup> was accomplished with dicyclohexylcarbodiimide (DCC)<sup>13</sup> to provide the dipeptide 8. Ester hydrolysis with potassium hydroxide afforded the desired carboxylic acid which was then protected as a phenacyl (Pac) ester 9. Coupling with the tyrosine derivative BocMe<sub>2</sub>TyrOH<sup>14</sup> followed by removal of the Boc protecting group<sup>15</sup> afforded 10. Removal of the phenacyl function<sup>17</sup> provided the key fragment 5.

Reagents: a) (i)  $\text{CH}_3\text{I}$ ,  $\text{NaH}$ ,  $\text{THF}$ ; (ii)  $\text{L-ThrOEt}$ ,  $\text{DCC}$ ,  $\text{CH}_2\text{Cl}_2$ ; b) (i)  $\text{KOH}$ ,  $\text{MeOH}$ ; (ii)  $\text{phenacylBr}$ ,  $\text{Et}_3\text{N}$ ,  $\text{EtOAc}$ ; c)  $\text{BocMe}_2\text{TyrOH}$ ,  $\text{DCC}$ ,  $\text{DMAP}$ ,  $\text{CH}_2\text{Cl}_2$ ; d)  $\text{Zn}$ ,  $\text{HOAc}/\text{H}_2\text{O}$ .

**Synthesis of Tetrapeptide 6.** The construction of fragment 6 involves two novel subunits (2*S*,4*S*)-aminoisovalerylpropionic acid (Aip) and (3*S*,4*R*,5*S*)-isostatine (Ist). The synthesis of the required isostatine derivative involves (2*R*,3*S*)-*allo*-isoleucine. The expensive (2*R*,3*S*)-*allo*-isoleucine can be obtained from commercially available (2*S*,3*S*)-isoleucine, 11, by conversion to the hydroxy acid with retention and its conversion in two steps to the amino acid with inversion (Scheme III).<sup>18</sup> Conversion of (2*S*,3*S*)-isoleucine to the corresponding  $\alpha$ -hydroxy acid 12 was accomplished by using a well-known procedure<sup>19</sup> that allows overall retention of configuration via a double inversion. Esterification was carried out with acetyl chloride in methanol, and the corresponding  $\alpha$ -hydroxy methyl ester was transformed into the tosyloxy methyl ester 13. Treatment of the tosylate with sodium azide in DMF provided the  $\alpha$ -azido ester 14 stereoselectively. Saponification of the ester afforded the  $\alpha$ -azido acid 15. Hydrogenation of the azide to the free amine proceeded readily in methanol at atmospheric pressure using Pearlman's catalyst (20% palladium hydroxide on carbon),<sup>20</sup> to afford (2*S*,3*S*)-*allo*-isoleucine 16.

Scheme III

- 5 -

The major portion of the isostatine subunit, D-allo-isoleucine, 16, was transformed into the *tert*-butoxycarbonyl (Boc) acid under standard conditions.<sup>16</sup> After activation of its carboxyl group as the imidazolide by use of carbonyldiimidazole, treatment with the magnesium enolate of ethyl hydrogen malonate afforded the required  $\beta$ -keto ester 18. The reduction by  $\text{NaBH}_4$  of the carbonyl group of the  $\beta$ -keto ester was effectively stereospecific, generating the desired (3*S*, 4*R*, 5*S*)-19a as the major product (>10:1) after chromatographic separation. Saponification afforded the required Boc-(3*S*, 4*R*, 5*S*)-Ist-OH, 20 (Scheme IV).

Scheme IV

The next step toward the synthesis of the tripeptide fragment (6) involved formation of the amino Hip subunit. This unit was synthesized from Cbz-L-valine, 21, utilizing a procedure based in part on the work of Nagarajan.<sup>21</sup> After activation of its carboxyl group as the imidazolide by use of carbonyldiimidazole, treatment with the magnesium enolate of ethyl hydrogen methyl malonate (EHMM) afforded the required  $\beta$ -keto ester 22. Sodium borohydride

- 6 -

reduction of the  $\beta$ -keto ester produced a diastereomeric mixture of alcohols which were separable by column chromatography. Following saponification and coupling with L-leucine methyl ester (L-LeuOMe), flash chromatography afforded the desired compound 23. Saponification produced the acid and treatment with phenacyl (Pac) bromide provided the protected derivative 24. Oxidation of the secondary alcohol with pyridinium chlorochromate on alumina<sup>22</sup> provided the  $\beta$ -keto amide. Removal of the phenacyl protecting group provided the free acid which was coupled with L-proline trimethylsilylester. Catalytic hydrogenation removed the Cbz protecting group and coupling of the isostatine subunit 20 with the amine produced the diprotected tetrapeptide. The Boc protecting group was then removed under standard conditions<sup>15</sup> to afford the key tetrapeptide unit 6 (Scheme V).

**Synthesis of Linear Heptapeptide 4.** The synthesis of the linear heptapeptide involved coupling of the two subunits, Cbz-D-MeLeuThr(OMe<sub>2</sub>TyrBoc)OH, 5, and H-IstAipLeuProOTMS, 6. A variety of coupling methods (BopCl,<sup>24</sup> DCC, EEDQ<sup>25</sup>) were attempted, however, the EDCI method<sup>26</sup> was shown to be the most efficient. Deprotections of the trimethylsilyl ester and the Boc functions were performed under standard conditions to give the linear heptapeptide 7. Cyclization was achieved by treatment with EDCI and catalytic

## DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

We have described the total synthesis of the amino Hip analogue of didemnin A. Previous studies have shown that didemnins are subject to hydrolysis and undergo decomposition due to the instability of the ester bonds. Replacement of the ester bond with an amide linkage should increase the maintenance of the active cyclic conformation and, thus, provide a compound of greater activity.

**General Experimental Procedures.**  $^1\text{H}$  NMR spectra were recorded on Varian XL-200, General Electric QE-300, Varian XL-400, and General Electric QN-500 spectrometers.  $^1\text{H}$  chemical shifts are referenced in  $\text{CDCl}_3$  and methanol- $d_4$  to residual  $\text{CHCl}_3$  (7.26 ppm) and  $\text{CD}_2\text{HOD}$  (3.34 ppm). Electron impact (EI) mass spectra were recorded on a Finnigan MAT CH-5 DF spectrometer. High resolution (HRFAB) and fast atom bombardment (FAB) mass spectra were recorded on a VG ZAB-SE mass spectrometer operating in the FAB mode using magic bullet matrix.<sup>27</sup> Microanalytical results were obtained from the School of Chemical Sciences Microanalytical Laboratory. Infrared (IR) spectra were obtained on an IR/32 FTIR spectrophotometer. Solid samples were analyzed as chloroform solutions in sodium chloride cells. Liquids or oils were analyzed as neat films between sodium chloride plates.

Optical rotations (in degrees) were measured with a DIP 360 or a DIP 370 digital polarimeter with an Na lamp (589 nm) using a 5- X 0.35-cm (1.0 mL) cell. Melting points were determined on a capillary melting point apparatus and are not corrected. Normal phase column chromatography was performed using Merck-kieselgel silica gel (70 - 230 mesh). Fuji-Davison C18 gel (100 - 200 mesh) was used for reversed phase column chromatography. All solvents were spectral grade. Analytical thin layer chromatography was performed on precoated plates (Merck, F-254 indicator). These plates were developed by various methods including exposure to ninhydrin, iodine, and UV light (254 nm). HPLC was performed with a Waters 990 instrument and an Econosil C18 column (Alltech/Applied Science) and a Phenomenex C18 column.

THF was distilled from sodium benzophenone ketyl and  $\text{CH}_2\text{Cl}_2$  from  $\text{P}_2\text{O}_5$ . Dimethylformamide (DMF), triethylamine ( $\text{Et}_3\text{N}$ ), and *N*-methylmorpholine (NMM) were distilled from calcium hydride and stored over KOH pellets. Pyridine was distilled from KOH and stored over molecular sieves. Other solvents used in reactions were reagent grade without purification. Di-*tert*-butyl dicarbonate  $[(\text{BocO})_2\text{O}]$ , dicyclohexylcarbodiimide (DCC), 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDCI), dimethylaminopyridine

(DMAP), 1-hydroxybenzotriazole (HOBT), D- and L-isoleucine, L-tyrosine, L-isoleucine, L-threonine, D-valine, and L-proline were obtained from the Aldrich Chemical Company. All reactions requiring anhydrous conditions were performed under an atmosphere of nitrogen.

**N-Benzylloxycarbonyl-N-methyl-D-leucine (Cbz-D-MeLeuOII).** Sodium hydride (60% dispersion, 6.47 g, 162.9 mmol) was added portionwise, with cooling, to a solution of Cbz-D-LeuOH (14.4 g, 54.3 mmol) in THF (21.4 mL) was added portionwise, with cooling. Methyl iodide (27.0 mL, 435 mmol) was then added via a dropping funnel. The reaction was allowed to stand at room temperature for 24 h. Ethyl acetate (70 mL) was slowly added to the reaction mixture, followed by water, to destroy the excess sodium hydride. The solution was then evaporated to dryness and the oily residue partitioned between ether (30 mL) and water (60 mL). The ether layer was washed with aqueous sodium bicarbonate (5 mL) and the combined aqueous layers were acidified with 4N HCl to pH 3. The solution was extracted with ethyl acetate (3 X 15 mL) and the extract washed with 5% aqueous sodium thiosulfate (2 X 10 mL) and water (10 mL). The solution was dried over sodium sulfate and the solvent evaporated to give an oily residue which crystallized overnight. Recrystallization from petroleum ether produced a white solid (12.7 g, 84%);  $[\alpha]_D^{25} + 24.7^\circ$  (c 0.02, CHCl<sub>3</sub>), Lit. 11b  $[\alpha]_D^{25} + 26.9^\circ$  (c 0.02, CHCl<sub>3</sub>); m.p. 71-72°C (Lit. 11b 72-73°C); <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>)  $\delta$  7.40-7.27 (5H, m), 5.17 (2H, s), 4.74 (1H, m), 2.87 (3H, s), 1.78-1.76 (2H, m), 1.62-1.57 (1H, m), 0.92-0.80 (6H, m); FABMS 280.2 (M + H), 236.2 (M - CO<sub>2</sub>); HRFABMS Calcd for C<sub>15</sub>H<sub>22</sub>NO<sub>4</sub> (M + H) 280.1549, Found 280.1556; Anal. **L-Threonine Ethyl Ester (L-ThrOEt).** A current of dry HCl was passed through a suspension of L-threonine (35.0 g, 0.29 mol) in absolute ethanol (350 mL), with shaking, until a clear solution formed. The solution then refluxed for 30 min, and was evaporated to dryness under reduced pressure, and the oily residue was taken up in absolute ethanol (175 mL) and, again, taken to dryness under reduced pressure. The oily residue was then treated with a saturated solution of ammonia in chloroform. The ammonium chloride was filtered off and the

- 10 -

filtrate was taken to dryness at 0°C under reduced pressure. A yellow solid was isolated (36.2 g, 85%);  $[\alpha]^{29}_{\text{Na}} + 0.82^\circ$  (c 5.0, EtOH), Lit.  $^{12} [\alpha]^{29}_{\text{D}} + 0.95^\circ$  (c 5.0, EtOH); m.p. 51-53°C (Lit.  $^{12}$  52-54°C);  $^1\text{H}$  NMR (200 MHz,  $\text{CDCl}_3$  w/ TMS)  $\delta$  4.82 (1H, m), 4.40 (1H, d), 4.05 (2H, q), 1.62 (3H, d), 1.21 (3H, t); FABMS 148.2 (M + H); HRFABMS Calcd for  $\text{C}_6\text{H}_{14}\text{NO}_3$  (M + H) 148.0974, Found 148.0972.

**Z-D-Methylleucylthreonine Ethyl Ester (8).** Z-D-MeLeuOH (2.12 g, 7.59 mmol) was dissolved in 100 mL of  $\text{CH}_2\text{Cl}_2$  and cooled to 0°C. DCC (1.72 g, 8.35 mmol) was added and the solution was stirred at 0°C for 10 min. L-ThrOEt (1.12 g, 7.59 mmol) in 5 mL of  $\text{CH}_2\text{Cl}_2$  was added and the solution was allowed to warm to rt. After approximately 15 h, dicyclohexylurea was removed by filtration and washed with  $\text{CH}_2\text{Cl}_2$ . The filtrate was washed with 10% citric acid, 5% sodium bicarbonate, and water and dried over sodium sulfate. The solution was evaporated to dryness and the product purified by silica gel column chromatography (hexane/EtOAc = 65/35) to afford the product as a yellow oil (2.35 g, 76%);  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ )  $\delta$  7.36-7.42 (5H, m), 6.73 (1H, d), 6.50 (1H, br s), 5.18 (2H, s), 4.83 (1H, m), 4.51 (1H, m), 4.30 (1H, m), 4.17 (2H, q), 2.81 (3H, s), 1.74 (2H, m), 1.70 (3H, d), 1.68 (1H, m), 1.20 (3H, t), 0.82-0.90 (6H, m); FABMS 431.4 (M + Na), 409.2 (M + H); HRFABMS Calcd for  $\text{C}_{21}\text{H}_{33}\text{N}_2\text{O}_6$  (M + H) 409.2344. **Z-D-Methylleucylthreonine (Z-D-MeLeuThrOH).** Z-D-MeLeuThrOEt (1.80 g, 4.42 mmol) was dissolved in methanol and 2N KOH was slowly added to the mixture at 0°C. The solution was stirred for 2 h. TLC analysis ( $\text{CHCl}_3/\text{MeOH}$  95:5) showed the reaction to be complete. The mixture was neutralized using 2N HCl. The solvent was then evaporated. The solution was partitioned between ethyl acetate and water and the organic layer separated. Aqueous HCl was added to the aqueous layer to pH 3. This was extracted with ethyl acetate and all of the ethyl acetate extracts were combined. The solution was dried over  $\text{MgSO}_4$  and the solvent evaporated to give a dark orange oil (1.77 g, 98%) which was used for the next reaction without purification;  $^1\text{H}$  NMR (200 MHz,  $\text{CDCl}_3$ )  $\delta$  7.36-7.41 (5H, m), 6.72 (1H, s), 6.52 (1H,

**Z-D-Methylleucylthreonine Phenacyl Ester (9).** Z-D-MeLeuThrOH (1.50 g, 3.95 mmol) was dissolved in ethyl acetate (25 mL). Triethylamine (0.39 g, 3.95 mmol) and phenacyl bromide (0.79 g, 3.98 mmol) were added and, within a few minutes, a precipitate formed. The mixture was stirred overnight. At this time, water and ether were added and the two layers separated. The organic layer was washed with 0.1N HCl, saturated sodium bicarbonate, and brine, and then dried over  $MgSO_4$ . The residue was chromatographed on silica gel (hexane/EtOAc = 4/1) to give a clear oil (1.71 g, 87%);  $^1H$  NMR (200 MHz,  $CDCl_3$ )  $\delta$  7.34-7.41 (10H, m), 6.71 (1H, s), 6.52 (1H, br s), 5.27 (2H, s), 5.18 (2H, s), 4.83 (1H, m), 4.61 (1H, m), 4.50 (1H, m), 2.81 (3H, s), 1.74 (2H, m), 1.70 (3H, d), 1.68 (1H, m), 0.82-0.90 (6H, m); FABMS 537.1 (M + K), 499.1 (M + H); HRFABMS Calcd for  $C_{27}H_{35}N_2O_7$  (M + H) 499.2444. Found 499.2450.

**N-tert-Butoxycarbonyl-tyrosine (BocTyrOH).**<sup>16</sup> Tyrosine ethyl ester (5.06 g, 25 mmol) was dissolved in 25 mL of water and solid sodium hydroxide was added until litmus paper indicated a neutral pH. Dioxane (50 mL) and  $(Boc)_2O$  (6.12 g, 27.5 mmol) were added with cooling. The reaction was allowed to stir for 2 h. Water and ether were added and the two layers separated. The organic layer was extracted three times with aqueous sodium hydroxide (1N). The aqueous layers were allowed to sit overnight then neutralized with aqueous HCl and extracted with ether, which was washed with brine and dried over  $MgSO_4$ . A yellow oil was obtained (6.02 g, 86%);  $^1H$  NMR (200 MHz,  $CDCl_3$ )  $\delta$  7.10 (2H, d), 6.84 (2H, d), 4.92-5.00 (1H, m), 4.47-4.52 (1H, m), 3.00-3.12 (2H, m), 1.43 (9H, s); EIMS 282.0.

**N-tert-Butoxycarbonyl-N,O-dimethyltyrosine (BocMe<sub>2</sub>TyrOH).** A solution of BocTyrOH (5.30 g, 18.8 mmol) and methyl iodide (2.57 mL, 41.4 mmol) in 80 mL of dry THF was cooled to 0 °C and sodium hydride (60% dispersion, 2.47 g, 62.0 mmol) was added. The

- 12 -

reaction mixture was allowed to stir at 0 °C for 1 h, then at rt overnight. Excess sodium hydride was quenched by the dropwise addition of 10 mL of THF/H<sub>2</sub>O (1:1) and the solvents were removed *in vacuo*. After removal of the solvents, the deep orange gel was diluted with 30 mL of water and washed with pentane (2 X 30 mL). The aqueous phase was acidified with solid citric acid (pH 2). Ethyl acetate was used for extraction. The combined extracts were washed with brine, dried (MgSO<sub>4</sub>) and concentrated *in vacuo*. **Boc-Ist-Aip-Leu-Pro-OTMSe.** Boc-Ist-OH (7.51 mg, 27.3  $\mu$ mol) was dissolved in dry  $\text{CH}_2\text{Cl}_2$  (1.0 mL) and the solution was cooled to 0°C. DCC (10.52 mg, 0.089 mmol) was added and the mixture was stirred for 30 min at 0°C. H-Aip-Leu-Pro-OTMSe (3.28 mg, 27.3  $\mu$ mol) in  $\text{CH}_2\text{Cl}_2$  (1.0 mL) was added and the solution was stirred for 30 min at 0°C and at rt overnight. The residue was concentrated and taken up in ethyl acetate. The solution was washed with aqueous citric acid, aqueous sodium bicarbonate, dried over  $\text{MgSO}_4$ , and concentrated. The residue was purified by reversed phase HPLC using a gradient system of  $\text{CH}_3\text{CN}/\text{H}_2\text{O}$  (45.0 mg, 83%); FABMS 741.5 (M + H), 641.5 (M - Boc).

**II-Ist-Aip-Leu-Pro-OTMSe (6).** The protected tetrapeptide (30.0 mg, 0.045 mmol) was dissolved in MeOH (2 mL) and a steady current of HCl was passed through the solution for approximately 20 min. Evaporation of the solvent produced a yellow oil which was purified by reversed phase column chromatography eluting with  $\text{CH}_3\text{CN}/\text{H}_2\text{O}$  (gradient system) to give 22.0 mg (87%) of the compound as a yellow powder; FABMS 641.5 (M + H), see Supplementary Material, S-2.

**Cbz-D-MeLeu-Thr[O-(*N,O*-Me<sub>2</sub>TyrBoc)]-Ist-Aip-Leu-Pro-OTMSe (4).** Acid 5 (21.9 mg, 28.4  $\mu$ mol) and *N*-methylmorpholine (6.4  $\mu$ L) were dissolved in dry THF (0.4 mL), and the solution was cooled to 0 °C. A solution of amine 6 (18.2 mg, 28.4  $\mu$ mol) and HOBT (0.81 mg) in 1.5 mL of dry THF were added. This suspension was mixed with a cold solution of EDCI (9.76 mg, 51.1  $\mu$ mol) in 0.5 mL of THF. The reaction mixture was stirred at 0°C for 1/2 h. The solution was then concentrated to 0.50 mL, kept at 0 °C for 24 h, then diluted with ether. The

organic layer was washed with 10% HCl, 5% NaHCO<sub>3</sub>, and saturated NaCl solutions. The organic layer was dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated. The crude oil was purified by reversed phase HPLC using a gradient system of CH<sub>3</sub>CN/H<sub>2</sub>O to give 11.6 mg (32%) of the linear heptapeptide, see Supplementary Material, S-3; FABMS 1294.2 (M + H); 1194.2 (M - Boc), see supplementary material, S-4; HRFABMS Calcd for C<sub>67</sub>H<sub>108</sub>N<sub>7</sub>O<sub>16</sub>Si (M + H) 1294.7649, Found 1294.7644.

Cbz-D-MeLeu-Thr-N,O-Me<sub>2</sub>Tyr-Ist-Alp-Leu-ProOH (7). 1M TBAF (2.1 µL) was added to a solution of the fully protected linear heptapeptide (5.80 mg, 4.50 µmol) in dry THF. After 2 h stirring at 0 °C, the mixture was diluted with distilled water and concentrated to a small volume. The remaining solution was diluted with EtOAc and 2N HCl was added to render the aqueous layer acidic. The EtOAc layer was washed three times with water and dried with Na<sub>2</sub>SO<sub>4</sub>. Evaporation of the solvent gave the deprotected heptapeptide in quantitative yield (4.3 mg); FABMS 1194.2 (M + H); 1094.2 (M - Boc), see Supplementary Material, S-5; HRFABMS Calcd for C<sub>62</sub>H<sub>100</sub>N<sub>7</sub>O<sub>14</sub>Si (M + H) 1194.7098, Found 1194.7089. The deprotected heptapeptide was subjected to a solution of 1M TFA (9.57 µL). After 1 h stirring at room temperature, the solvent was evaporated. Water was added to the residue and the aqueous solution was extracted with EtOAc. The extract was washed with 5% NaHCO<sub>3</sub> and water, and dried over Na<sub>2</sub>SO<sub>4</sub>. The compound was purified by reversed phase HPLC using a gradient system of CH<sub>3</sub>CN/H<sub>2</sub>O (see Supplementary Material, S-6) to give 3.58 mg (91%); FABMS 1094.2 (M + H), see supplementary material, S-7.

AlpDidemnin A (8). The linear heptapeptide 4 (3.58 mg, 3.28 µmol) was dissolved in dry THF (0.80 mL), and the solution was cooled to 0°C. EDCI (0.63 mg, 3.28 µmol) in 1.0 mL of THF was added, and the reaction mixture was stirred at 0°C for 2 h. After storage in the freezer overnight, the solution was diluted with ether. The organic layer was washed with 10% HCl, 5% NaHCO<sub>3</sub>, and saturated NaCl solutions. The organic layer was dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated. The crude oil was purified by reversed phase HPLC using a gradient system of CH<sub>3</sub>CN/H<sub>2</sub>O to give 1.41 mg (40%) of the protected analogue; FABMS 1076.7 (M +

**WHAT IS CLAIMED IS:**

1. The compound Cbz-[Aip<sup>3</sup>]-Didemnin A.
2. The compound [Aip<sup>3</sup>]-Didemnin A.
3. The compound (2S,4S)-aminoisovalerylpropionic acid (Aip).
4. The compound (3S,4R,5S)-isostatine (Ist).
5. A synthetic process for the formation of the Amino Hip analogue of Didemnin A, said process comprising the steps of:
  - (a) forming a linear heptapeptide by coupling two subunits, Cbz-D-MeLeuThr(OMe<sub>2</sub>TyrBoc)OH (5) and H-IstAipLeuProOTMSe (6), followed by deprotection to yield the linear heptapeptide (7); and
  - (b) cyclization of heptapeptide (7) afforded the amino Hip (Aip) analog of Didemnin A.
6. The intermediate compound having the formula 5:

- 28 -

7. The intermediate compound having the formula 6:

6

8. The intermediate compound having the formula 7:

7

3. A pharmaceutical composition comprising Cbz-[Aip3]didemninn A and an optional pharmaceutically acceptable excipient, diluent or carrier.
4. A pharmaceutical composition comprising [Aip3]didemninn A and an optional pharmaceutically acceptable excipient, diluent or carrier.
5. A method of treating mammalian neoplastic tumors comprising administering to a mammal in need of such treatment, an effective amount of a pharmaceutical composition defined in claim 3 or 4.
6. A method of treating mammalian RNA or DNA viral infections

comprising administering to a mammal in need of such treatment, an effective amount of a pharmaceutical composition defined in claim 3 or 4.

7. A method of treating mammalian bacterial infections comprising administering to a mammal in need of such treatment, an effective amount of a pharmaceutical composition defined in claim 3 or 4.

8. A method of treating mammalian fungal infections comprising administering to a mammal in need of such treatment, an effective amount of a pharmaceutical composition defined in claim 3 or 4.

9. A method of promoting immunosuppression in mammals comprising administering to a mammal in need of such treatment, an effective amount of a pharmaceutical composition defined in claim 3 or 4.
